

## Analysis of Subway Traffic near Landmark Locations

The focus of the data analysis is to find at which areas (where the attractions are) are more crowded at what months or weeks specially during the holiday seasons.

Due to our client needs, the subset of the data is turned into days instead of time with specific hours during the day.

For an example as seen on the geographic scatter plot, the red dots represent traffic of stations of an area near a specific landmark. As shown below is the Columbus Circle and Coliseum Park.
